SOLID EF DISPENSER

PRODUCT OVERVIEW

With the simple addition of our Solid EF wetting agent dispenser, you can convert your existing spray unit into an effective fire-fighting tool.

Using the high-pressure water flow in your spray unit, water from the tank passes through the dispenser and over the water-soluble cartridge, adding a wetting agent with a foam-like consistency.

This enables the water to coat the fire surface more effectively and delay runoff during a fire. The lightweight aluminium dispenser offers all the benefits of a fire-fighting foam without the complexity of plumbing systems and heavy foam drums.
